Machine Learning to optimize a Stock Market Indicator

Nicolas Boinay and Matteo Nottaris

January 2021

Project Origin

RSI indicator:

Project Origin

RSI indicator:

- Indication on the trend of an asset
- Two parameters : an upper and a lower one
- RSI signal over the upper one \Rightarrow asset overbought \Rightarrow selling recommended

Project Origin

RSI indicator:

- Indication on the trend of an asset
- Two parameters : an upper and a lower one
- RSI signal over the upper one \Rightarrow asset overbought \Rightarrow selling recommended

Goal:

• Optimize the parameters choice for each market situation

Project description

Core of the project:

- Extract data sets to get a market situation
- Two websites : AlphaVantage Yahoo Finances
- Build what we call a market situation
- Get the optimal parameters for a specific market situation

Main Goal

How to get the right parameters for each market situation :

- Imagine having a certain amount of money at the beginning of a year.
- Calculate the benefits for given parameters and return the date with highest performance
- Do it for 80 pairs of parameters and return for each the highest performance

How to do it

Neural network's training data set

Train a neural network:

- Inputs is a vector(19,1) corresponding to a market situation
- Output is a vector(2,1) corresponding to the optimal parameters for this market situation
